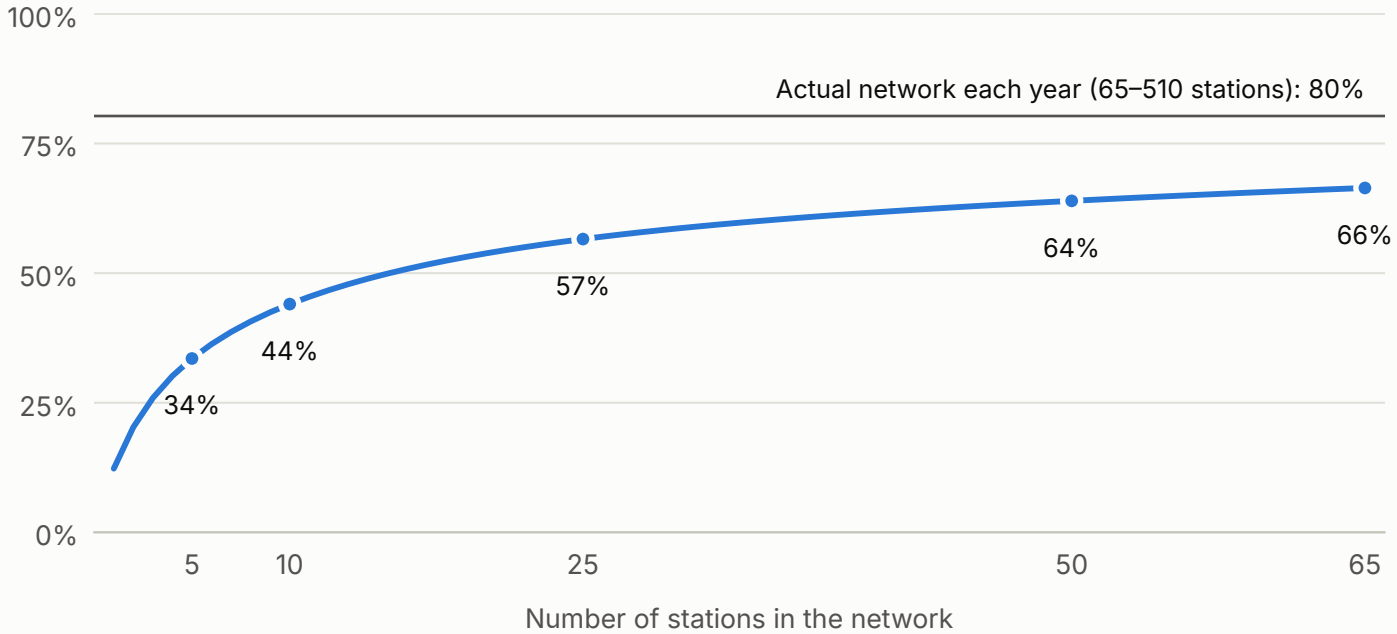
More stations, more white Christmases

Same 66 Christmas Days (1960–2025), same weather. Share that would count as 'white' under the official rule (snow or sleet at any station) if the network had only this many stations.



Exact calculation (hypergeometric), averaged over the same 66 years for every network size; no simulation.
Assumes stations are drawn at random from each year's network, ignoring geography. Curve stops at 65, the smallest yearly network.

Data: Met Office MIDAS Open, UK daily weather observations (v202607), via CEDA. Open Government Licence.
